Umeå University,

901 87, Sweden.

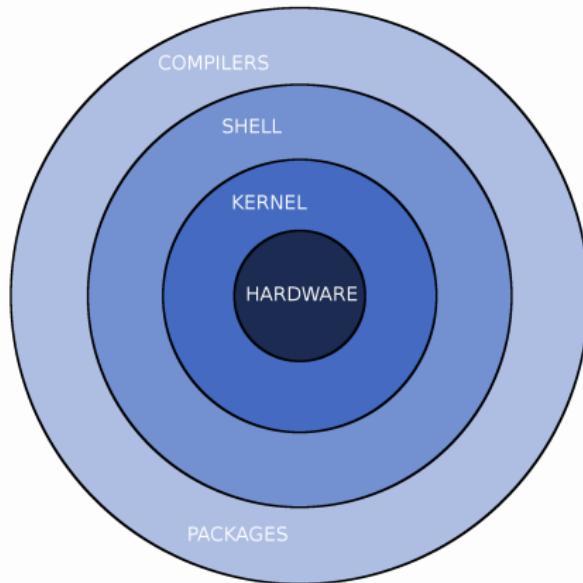

# Table of contents

- 1 Linux
- 2 Navigating the File System
- 3 Data Handling
- 4 Finding Patterns
- 5 Scripting
- 6 More advanced topics

# Linux OS

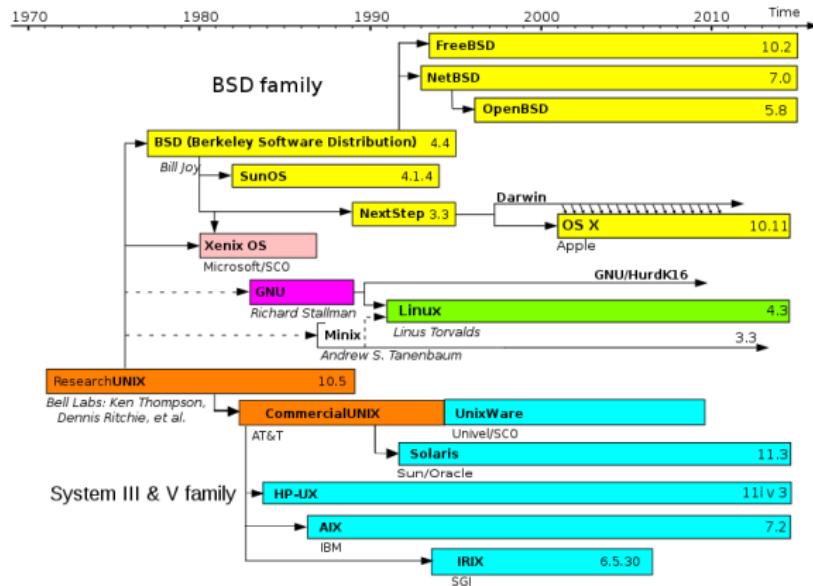

Linux OS components.

# Linux

- UNIX-like OS
- used in modern Android smartphones
- the difference between all UNIX-like OS is small

# Linux timeline

source: wikipedia

# The Linux terminal

```
Terminal [pedro@pedro-HP-EliteBook-840-G3] - [~] - [2017-02-08 03:18:48]
[0] >>
```

- on the terminal you can see the so-called Prompt
- here you can control your PC/account or even a remote server

# Files organization

```
[pedro@pedro-HP-EliteBook-840-G3] ~ [0] >> tree -dx -L 1
└─[0] tree
    └── .
        ├── bin
        ├── boot
        ├── cdrom
        ├── dev
        ├── etc
        └── home
            └── [home]
                └── .
                    ├── lib
                    ├── lib64
                    ├── lost+found
                    ├── media
                    ├── mnt
                    ├── opt
                    ├── proc
                    ├── root
                    ├── run
                    └── sbin
```

The terminal command `tree -dx -L 1` is used to display the directory structure starting from the current working directory (~). The output shows the following hierarchy:

- Root directory (indicated by a red box):
  - bin
  - boot
  - cdrom
  - dev
  - etc
  - home
    - home (indicated by a red box)
  - lib
  - lib64
  - lost+found
  - media
  - mnt
  - opt
  - proc
  - root
  - run
  - sbin

[/]  
root

# man

Manual pages.

## ● **man command: man nano**

NANO(1)

General Commands Manual

NANO(1)

### NAME

nano - Nano's ANOther editor, an enhanced free Pico clone

### SYNOPSIS

nano [options] [[+line,column] file]...

### DESCRIPTION

nano is a small, free and friendly editor which aims to replace Pico, the default editor included in the non-free Pine package. On top of copying Pico's look and feel, nano also implements some missing (or disabled by default) features in Pico, such as "search and replace" and "go to line and column number".

# Navigating the File System

# ls

List the content of a directory

```
$ls  
1CD9
```

```
$ls -l  
total 24843644  
drwxrwxr-x 2 pedro pedro 4096 nov 9 11:17 1CD9
```

```
$ls -la  
total 24844368  
drwxr-xr-x 44 pedro pedro 4096 feb 13 13:19 .  
drwxr-xr-x 3 root root 4096 sep 19 11:05 ..  
drwxrwxr-x 2 pedro pedro 4096 nov 9 11:17 1CD9
```

```
$ls -lah  
total 24G  
drwxr-xr-x 44 pedro pedro 4,0K feb 13 13:25 .  
drwxr-xr-x 3 root root 4,0K sep 19 11:05 ..  
drwxrwxr-x 2 pedro pedro 4,0K nov 9 11:17 1CD9
```

# ls

```
$ls -laht
total 24G
drwxr-xr-x 44 pedro pedro 4,0K feb 13 13:29 .
-rw----- 1 pedro pedro 431K feb 13 13:29 .zsh_history
drwx----- 6 pedro pedro 4,0K feb 13 13:28 Linux_Abisko_Kebne

$ls -lahrt
total 24G
-rw-r--r-- 1 pedro pedro 655 sep 19 11:05 .profile
```

# chmod

Change permissions.

Useful cases:

- chmod Y+Z
- Y=u,g,o
- Z=r,w,x

# cd

Change directory.

Useful cases:

- cd directory  
move to "directory"
- cd  
move to  $\$HOME$  directory
- cd -  
move to previous visited directory
- cd ..  
move to upper directory in the hierarchical tree
- pwd prints out the local directory path

# cp

Copy files.

Useful cases:

- `cp text.txt directory/`  
copy text.txt file to "directory"
- `cp -r test/ directory/`  
copy the directory test into directory/.  
`cp` overwrites existing files!

# touch/mkdir

Create files.

Useful cases:

- `touch text.txt`  
creates `text.txt` file
  
- `mkdir test`  
creates the directory `test`

# rm

Remove files.

Useful cases:

- `rm text.txt`  
deletes `text.txt` file
  
- `rm -rf test/`  
deletes the directory `test`  
deleted files cannot be recovered!

# Wild cards

- ?  
it represents a single character
- \*  
it represents a string of characters
- [0 – 9] , [A – B]  
it represents a range of numbers or characters

## Symbolic links

also called soft links is a pointer file to other file/directory. One can create a soft link with the *ln* command:

```
ln -s source.txt link
```

```
ls -l source.txt link
```

```
lrwxrwxrwx 1 pedro pedro 14 sep 8 22:14 link -> source.txt
-rw-r--r-- 1 pedro pedro 0 sep 8 22:13 source.txt
```

# Redirection

we can change the standard input (keyboard)/output (screen) of Linux commands:

- The operator `>` redirects the output of some command  
`ls > test.dat`  
in this case to the file `test.dat`
- The operator `>>` concatenate the output of some command to the content of a file:  
`ls >> test.dat`
- The operator `<` changes the standard input
- The operator `2 >` redirects the standard error:  
`exec2 > error.log`
- The operator `2 > &1`, redirects both standard output and error: `exec > logfile2 > &1`

# Pipes

- One can use the output of some command as the input for another command:

```
grep 'string' file.txt | wc
grep 'string' file.txt > file.out
grep 'string' file.txt >> file.out
```

# Exporting variables

- some programs or libraries require environment variables to work
- they allow the program to follow different schemes without being re-compiled
- some variables such as `$HOME` are intrinsic to Linux OS
- we need to export the variables for further use:

```
$export NUMBER_OF_THREADS=6
```

# Editing files

```
Terminal GNU nano 2.5.3 New Buffer Modified
new line [ ]
```

The screenshot shows a terminal window running the GNU nano 2.5.3 text editor. The title bar indicates the application name and version. The status bar shows 'New Buffer' and 'Modified'. The main area contains the text 'new line [ ]'. At the bottom, a series of keyboard shortcuts are listed:

$\wedge G$ Get Help	$\wedge O$ Write Out	$\wedge W$ Where Is	$\wedge K$ Cut Text	$\wedge J$ Justify	$\wedge C$ Cur Pos	$\wedge Y$ Prev Page
$\wedge X$ Exit	$\wedge R$ Read File	$\wedge I$ Replace	$\wedge U$ Uncut Text	$\wedge T$ To Spell	$\wedge G$ Go To Line	$\wedge V$ Next Page

# Data Handling

# Compress/decompress files

Compressing files:

```
$ gzip file      --->  file.gz
```

Decompressing files:

```
$ gunzip file.gz
```

# Generating archives

Generate tar-ball:

```
$tar -cvf directory.tar directory
```

Opening tar-ball:

```
$tar -xvf directory.tar
```

# ssh

Command for connecting to a remote computer.

Useful cases:

- ssh username@abisko.hpc2n.umu.se  
connecting to abisko machine
- ssh -Xl username abisko.hpc2n.umu.se  
if you want to enable graphical display.

# sftp (scp)

Protocol for data transfer.

```
$sftp username@abisko.hpc2n.umu.se
```

```
$get file
```

```
$put file
```

# rsync

Protocol for synchronizing data.

```
rsync source target
```

```
rsync -az user@kebne.hpc2n.umu.se:/home/proj/ proj/
```

# Finding patterns

# grep

This command searches for patterns in text files.

Useful cases:

- `grep 'word' file`  
it searches for pattern 'word' in file
- `grep -r ine 'word' home`  
pattern word is searched recursively in the directory `/home`

# awk

This command finds patterns in a file and can perform arithmetic/string operations.

Useful cases:

- `awk '/gold/ {print$1}' file`
- it searches for pattern 'gold' in file and prints out the first column

# Scripting

# Scripting

- allows to perform complex tasks without user intervention
- all Linux commands can be used in a script including wild cards

# Scripting

analysis.sh

```
#!/bin/bash
```

```
grep 'ABCD' file.pdb > file_filtered.pdb
```

```
program < file_filtered.pdb > output.dat
```

execute script with ./analysis.sh

# Scripting

```
$ls -lah
total 24G
drwxrwxr-x  2 pedro  pedro  4,0K nov  9 11:17 1CD9
```

- permissions are set of "user", "group", or "others"
- we can change permissions with chmod command

For instance,

```
$chmod u+x analysis.sh
```

```
$execute script with ./analysis.sh
```

# Working with the Prompt

- **ctrl+a:** Go to the beginning of the line
- **ctrl+e:** Go to the end of the line
- **ctrl+l:** Clean the terminal

## Configuring .bashrc file

Exploring the history:

by typing "ctrl+r" you will be prompted to introduce text which bash will use to make a search in the list of commands you have typed previously. That list is saved in the .bash\_history file in your home directory.

One can control the behavior of the history file by setting environment variables in the .bashrc file as follows:

```
export HISTCONTROL=erasedups
export HISTSIZE=100000
export HISTFILESIZE=100000
shopt -s histappend
```

# Configuring .bashrc file

## Using aliases:

if you need to type a long command several times, you may add it as an alias in your .bashrc file:

```
alias ldir='ls -lahrt | egrep "^\d"
```

## Specific commands on our cluster

- projinfo: information of the usage of the project resources
- squeue -a -u username: status of the jobs for username
- sbatch script.sh: for job submission
- scancel jobid: for cancelling a job
- quota: information of the /home and /pfs disk usage
